

SESSION 6

Question 1: Escape Sequences and Special Characters

Question: Write and execute shell commands to handle escaped spaces, special symbols, and escape sequences.

```
teja@LAPTOP-FGDPB110:~$ echo "Hello World"
Hello World
teja@LAPTOP-FGDPB110:~$ echo -e "Hello\nWorld"
Hello
World
teja@LAPTOP-FGDPB110:~$ echo -e "Hello\tWorld"
Hello    World
teja@LAPTOP-FGDPB110:~$ echo -e "Hello\tWorld"
Hello    World
teja@LAPTOP-FGDPB110:~$ echo Hello\ World
Hello World
teja@LAPTOP-FGDPB110:~$ echo "Price is \$100"
Price is $100
teja@LAPTOP-FGDPB110:~$ echo "This is \"Linux\""
This is "Linux"
teja@LAPTOP-FGDPB110:~$ |
```

Short Theory: Escape sequences are used to represent special characters. `\n` creates a new line, `\t` creates a tab, and `\` is used to escape spaces or special symbols.

Question 2: Create Child Process and Execute Program

Question: Write a C program using `fork()` and `exec()` to create a child process and execute a Linux command.

```
GNU nano 2.2 child.c
echo "Hello World"
echo -e "Hello\nWorld"
echo -e "Hello\\ World"
echo Hello\\ World
echo "Price is \\$100"
echo "This is \\\"linux\\\""
echo 'Hello $USER'
echo "Hello $USER"
```

Short Theory: `fork()` creates a child process and `exec()` is used by the child to execute another program. The parent can use `wait()` to wait for the child to complete.
